Assignment 12: User UI and UX

Professor Dr. Ron Eaglin

Assignment:

For this assignment we are making sure that the application we are creating can be accepted by end users. We will select and perform evaluation methods and then report the results.

Title: User UI and UX

Objective:

To perform user acceptance and testing to develop proper UI and UX.

Methodology:

The Evaluation methods that I chose to use for my application are the Cognitive walkthrough, Heuristic Evaluation, and User Survey.

Application Overview:

This application is a CRUD-based user management system that was created using Express and SQLite. It allows the user to create, edit, and delete, and view through a web browser.

Cognitive Walkthrough:

Task: Create a new user

Steps:

1. User will open the homepage
2. Users enters username/email and password
3. User will enter the data
4. There will be a message letting the user know that only Admin can create their accounts

Findings:

- The form is easily accessible and visible
- The user has to wait on the Admin to know if they were created an account

Improvement:

- Add an option to let the user know if they are accepted into the system right away or in a waiting period

Heuristic Evaluation:

1. Visibility
 - The system does not have an entry box or button letting the user enter admin credentials
 - There is no where for a success or fail message to appear
2. Consistency
 - The style of layout and theme are consistent throughout the application
3. Error Prevention
 - Error message appears if invalid credentials are entered
4. User Control
 - No cancel or return option

Improvements:

- Add an entry box for admin credentials
- Add a space for a response message to appear for the user to let them know their status
- Add a cancel or return option

User Survey:

1. Was the application easy to use? (yes/no)

Surveyor 1: yes

Surveyor 2: yes

2. Was there anything unclear about how to use the application? (yes/no)

Surveyor 1: no

Surveyor 2: no

3. What would you improve?

Surveyor 1: Make the design more colorful and welcoming

Surveyor 2: nothing

4. How would you rate the interface? (1 [bad] to 5 [good])

Surveyor 1: 2

Surveyor 2: 4

User Observation:

Observed a user try to delete a user account

Findings: User was hesitant because there was no undo button

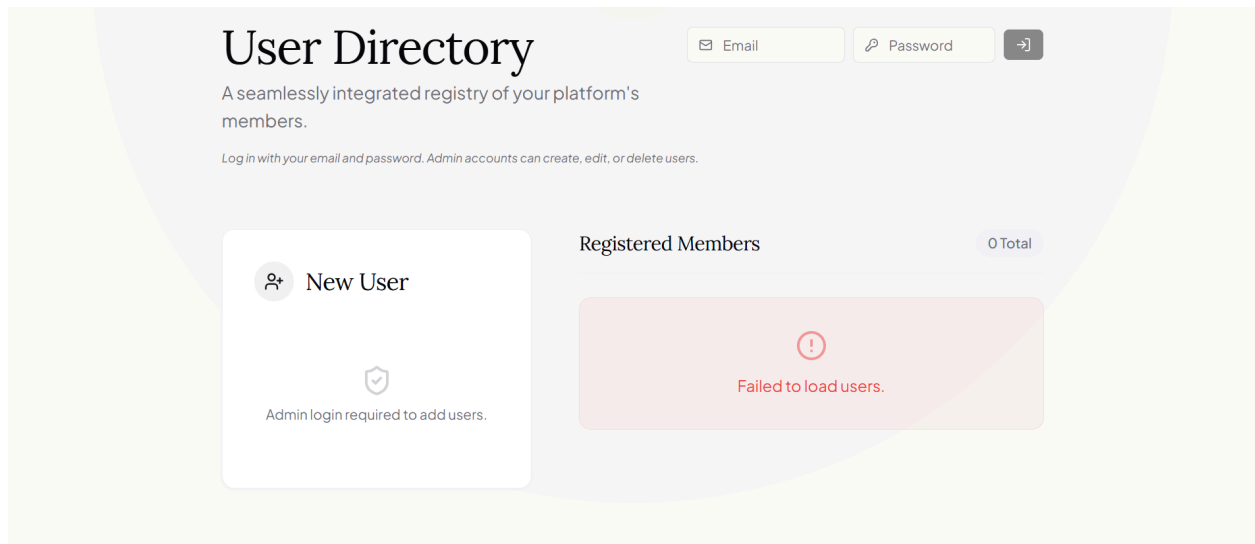

Improvements: Add an undo button and only allow admin to permanently delete a user account.

Final Improvements:

Some of the final improvements I made to my application is I fixed the log in screen for when users are creating a new account. Before there was no option for the admin to enter their credentials so I fixed that. I also fixed the error message that my system was unable to load any users, so now it is just waiting for users to log in or create an account.
