Executive Summary and Project Overview

Goals and Objectives

- Although we do not have a project idea in mind currently this software will complete all of the clients requests. I believe the goals that the developers have for the software will be to create something that can run correctly and efficiently while also making it help the client. The business goals would be to create a working software for the client and make running the clients business easier and more efficient.

Key Stakeholders and Roles

- Since we don't have a project idea in mind just yet all of the stakeholders are currently unknown but I believe them to be the Project Manager, the Project Team, and the Project Sponsor. I think the primary users would be the client and anyone that would be affected by when this is used in a business.

Business Value and Expected Outcomes

- Since we don't have a project idea yet I cannot say if this software would be marketable but I believe that would be our goal so we can help as much people as possible. I am also unsure of what specifically the savings and time would be but I know we are going to strive to make a software that meets the clients requirements and helps make anything more efficient.

Critical Success Factors

- I believe that what defines the success of a software is how much it meets the clients requirements and how well the software runs. I believe that even if there are mistakes or errors to fix that good because that means we can make the software better.

Interface Specifications

Interface Specifications

6.1 Overview of User Interface Design

- The Inventory and Sales System user interface is designed to be simple and efficient for managers and employees. The interface emphasizes clarity, consistency, and easy navigation.

6.2 User Roles

- Managers
- Employees

6.3 Use Case Scenarios

The manager or employee will log into the system on the login screen and then be moved onto the dashboard. They will then go into the inventory screen from the side menu. They will edit the inventory of 2 of the items after the week and add a new holiday item to the inventory.

6.4 Task Analysis

- Log in

The user opens the application.

Login screen is displayed.

The user enters an email.

User enters password.

The user clicks the login button.

System validates credentials.

The system redirects the user to the dashboard.

- Sales History

The Manager logs in.

The Manager selects “Sales History”.

The system retrieves transactions.

The system displays sales records.

The manager selects a transaction to view details.

6.5 Screen Designs

1. Login Screen

The login screen allows any employee to enter their username and password to access the inventory system

Inventory System Login

Password

Please enter password

Login

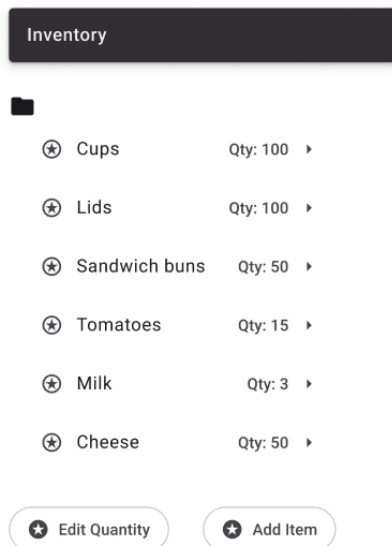

2. Dashboard

The dashboard has a drop down menu sidebar that lets you access any other feature for the inventory system.

3. Inventory Management

The inventory management screen lets you see any of the current inventory items and the quantity of them. There is also two buttons at the bottom of the screen that lets you edit the quantity and add an item to the list.

4. Sales Screen

The sales screen will have a weekly overview pop up as soon as you open the screen. There will then be a button to access previous sales. It will then have a button for you to click and shop for more inventory items and be able to checkout with them.

5. Reports Screen

The reports screen will show a report of the past weekly financials and how many customers we had. There will also be a button to show a graph of what days you were busiest and most productive.

6.6 Cognitive Walkthrough

- Log in screen

Clear field labels

Immediate error feedback

Visible login button

Simple layout reduces confusion

- Dashboard screen

Clear field labels

Simple layout reduces confusion

Clear menu button with clear drop down options

- Inventory screen

Clear labels

Simple layout reduces confusion

Clear buttons for actions

Clear lines for separated products

- Sales screen

Clear field labels

Simple layout reduces confusion

Clear overview organizing sales

Shopping cart button for buying items

Clear button for previous sales

- Reports screen

Clear field labels

Simple layout reduces confusion

Clear button for graph of past week productivity

6.7 Heuristic Evaluation

- Log In

Visibility of System Status

The system provides feedback when login credentials are incorrect by displaying an error message to the user.

Consistency and Standards

Input fields follow a standard layout with labels placed above text boxes, matching common login interfaces used in web applications.

Error Prevention

The system prevents login attempts when required fields are empty.

Minimalist Design

The login screen contains only essential elements: email field, password field, and login button.

- Inventory Management

Consistency and Standards

Buttons such as “Add Item,” “Edit Quantity,” are consistently styled and positioned.

Recognition Rather Than Recall

Product data is displayed in a table, allowing users to quickly recognize items instead of remembering details.

User Control and Freedom

Managers can edit or delete products easily from the inventory list.

- Sales

Visibility of System Status

The running total updates when items are added to the cart.

Error Prevention

The system prevents users from entering quantities larger than available inventory.

Match Between System and Real World

The sales interface mimics a point-of-sale system with a cart and checkout process.

- Report

Flexibility and Efficiency of Use

Managers can quickly view sales summaries and inventory alerts.

Aesthetic and Minimalist Design

Reports display only relevant information such as totals, low inventory items, and top-selling products.
